

Where it breaks

An honest self-review of the portfolio and its Netlify contact form. Tests covered negative form inputs, duplicate-submit behavior, responsive layouts, assets, links, SEO metadata, and speed-check availability.

Fix now — addressed

Finding	Fix	Evidence
Empty or malformed form entries	Required fields, email type, and 2/10-character limits added.	Empty and invalid-email form checks returned false.
Short or whitespace messages	Client-side trim validation gives a clear inline correction.	Message must contain at least 10 meaningful characters.
Fast double submit	Send button locks immediately after a valid submit.	Valid submit test set disabled=true and showed "Sending your message securely..."
Content/link cards relied on JavaScript	Logos and cards moved into static HTML; reveal hiding only starts after JS is ready.	Phone, tablet, and desktop checks found zero hidden sections and zero missing images.
Search/share metadata incomplete	Added canonical, Open Graph, and X/Twitter metadata.	Homepage source contains title, description, canonical, og:* and twitter:* tags.

Known limitations — named, not hidden

Limitation	Why it remains / next action
Browser validation is not a security boundary	A malicious client can bypass it. Keep Netlify honeypot enabled; add server-side rate limiting if spam becomes a problem.
LinkedIn automated check	LinkedIn returned HTTP 999 to automated requests. Verify it manually in a normal browser or on a phone.
Speed API rate limit	Google PageSpeed Insights responded with HTTP 429. Re-run the free audit after production deployment.
Real-phone and peer review	Browser-size simulation is complete, but a physical phone and independent mentor/peer review are still required before launch.
Production publishing	Hardening files are ready locally; publish them once Netlify deployment access is restored, then repeat the live checks.

Basic SEO / findability

Homepage title and description are present. Canonical URL points to <https://k-praveenkumar.netlify.app/>. Open Graph and X/Twitter title and description tags supply consistent sharing previews. Add the live domain to Google Search Console once the production hardening update is published.

Review hand-off

This is a structured self-review, not a claimed mentor review. Before launch, ask a mentor or peer to try breaking the contact form, open the site on a real phone, and identify only launch-blocking issues. Record their must-fixes in the accompanying Markdown log.
