

Mobile audit fix log

Scope: simulated phone (390 x 844), tablet (768 x 1024), and desktop (1440 x 900) viewport checks. This is browser/device-size testing, not a claim of a physical-phone test.

What changed

Before	After
Reveal sections could stay hidden when JavaScript did not run.	Reveals only hide after JavaScript is ready; reduced-motion and no-JS states stay visible.
Resume icon attached to the header through a broad script selector.	Logos and cards are now static HTML; the resume icon is inside the CV card.
No clear site-wide keyboard focus and small phone targets.	High-contrast focus outline and 44px targets for the monogram, footer link, and key action.
Booking placeholder looked live but had no destination.	Hidden until a real booking URL is supplied; visible links lead somewhere real.

Verification

No horizontal overflow, missing images, or hidden revealed sections were found at the three tested widths. Text uses 14–16px body sizing with comfortable line spacing and a high-contrast dark palette. The largest local image is the LinkedIn logo at about 119 KB; no oversized work images are present.

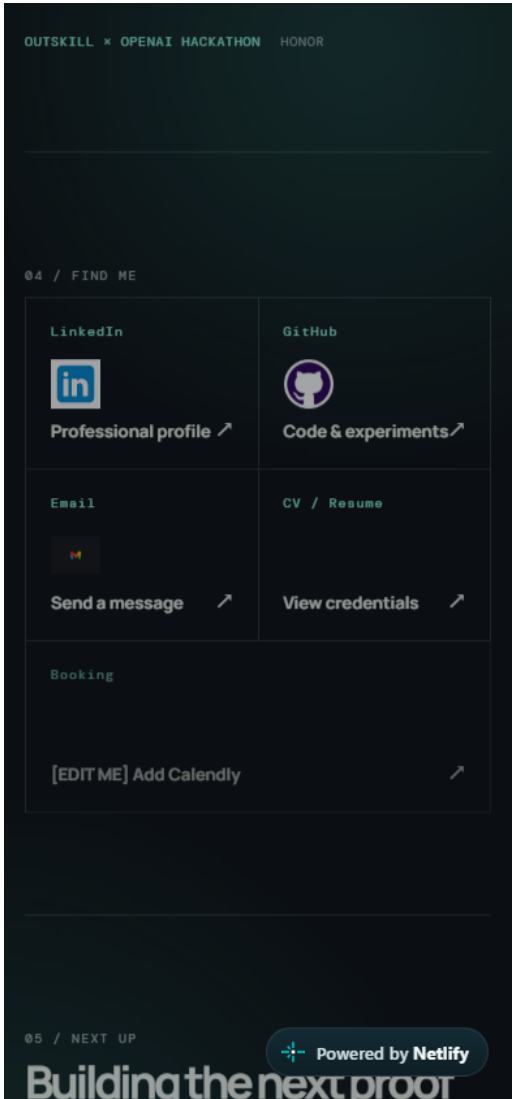

Link checks

The portfolio, contact page, thank-you page, GitHub profile, and Google Drive resume each returned HTTP 200. LinkedIn blocks automated audit traffic with HTTP 999, so it should receive one final human tap on a real phone.

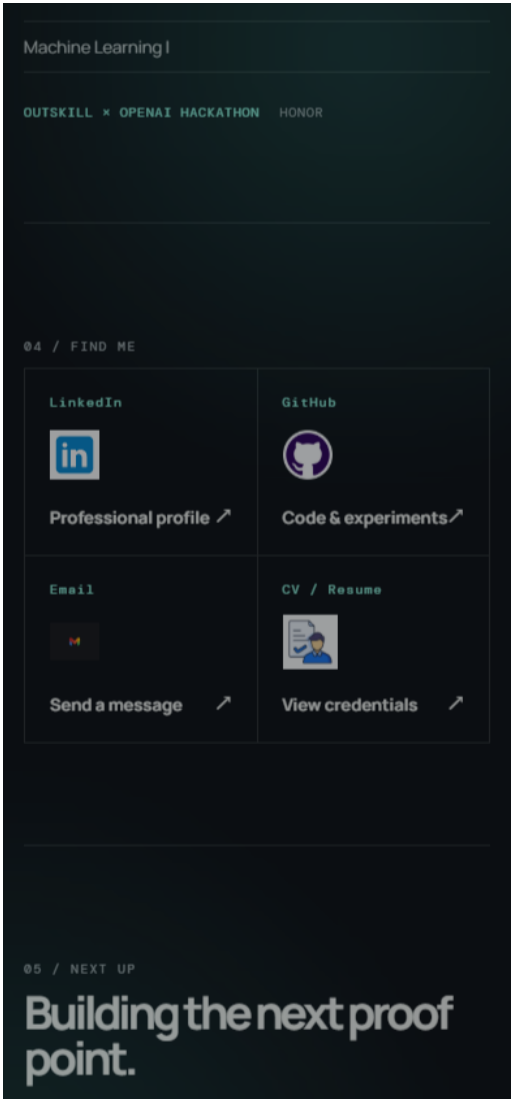

Final physical-phone check

Open the live URL on your phone and tap CV, LinkedIn, GitHub, Email/contact, and Back to top. Submit a contact-form test. This is the final manual confirmation the browser simulation cannot replace.

Link-card section

Before: no CV icon; inactive booking card remains visible.

After: CV icon is correctly placed; booking placeholder is hidden.
